

2 in 1 SOLAR POWERED LIGHT

HOW YOUR SOLAR POWERED LIGHT WORKS

The light is powered by a solar panel that is mounted on the back of the light. The solar panel converts sunlight into electricity, which is stored in a rechargeable battery. The battery powers the light, which is controlled by a photocell. The photocell senses the level of light and automatically turns the light on at dusk and off at dawn.

CHOOSING A LOCATION

Choose a location that is sunny and free of shade. The light should be placed in an open area where it can receive maximum sunlight. Avoid placing the light near trees or other structures that may cast shadows on it.

FIRST TIME USE

Before using the light, make sure the battery is fully charged. To charge the battery, place the light in direct sunlight for at least 6 hours. Once the battery is charged, the light will automatically turn on at dusk.

TROUBLESHOOTING

If the light does not turn on at dusk, check the battery level. If the battery is low, place the light in direct sunlight for at least 6 hours to recharge it. If the light still does not turn on, check the photocell. The photocell may be dirty or damaged, which could prevent it from sensing the light level correctly.

INSTALLATION TIPS

When installing the light, make sure the solar panel is facing the sun. The light should be placed in a location where it can receive maximum sunlight. Avoid placing the light near trees or other structures that may cast shadows on it.
